Executive Summary

Final-year Computer Science student specializing in cloud engineering, DevOps, backend systems, and AI-powered applications. I build and deploy scalable software systems by designing reliable cloud infrastructure, automated CI/CD pipelines, secure backend services, and intelligent data platforms, with a focus on solving complex engineering problems through robust system design, automation, and modern cloud technologies.

Education

VIT-AP University **2023 - 2027**

BTech in Computer Science and Engineering *Amaravati, Andhra Pradesh*

Experience

Full Stack Intern **June 2026 - Present**

Buymyplot *Remote*

- Stabilized the initial production version of the real-estate platform by diagnosing and resolving critical frontend, backend, and authentication issues across core user workflows, contributing to the onboarding of 150+ users.
- Built and integrated a Meta Ads marketing workflow, enabling users to promote their property listings directly through the platform and eliminating the need for manual campaign setup.
- Deployed and maintained the production platform on AWS EC2, supporting reliable production releases and minimizing service downtime.

Projects

SaaS Analytics Platform | GitHub | Live Demo

- Built a multi-tenant analytics SaaS platform with **145 implemented REST endpoints** using Node.js, Express, MongoDB, Redis, and React, supporting connectors, dashboards, reports, alerts, APIs, and embedded analytics.
- Implemented multi-tenant RBAC with **6 built-in roles** and tenant isolation to securely manage users, permissions, dashboards, and organization-scoped analytics.
- Engineered analytics workflows supporting **4 data connector types** and **6 dashboard visualization types**, with background processing, caching, audit logging, and AWS S3-based object storage using BullMQ, Redis, and Pino.

Vivasayi AI | GitHub | Live Demo

- Built an AI-powered agricultural assistant using LLMs, RAG, and curated agricultural knowledge to deliver context-aware farming guidance for Tamil Nadu.
- Containerized and deployed the backend on AWS Lambda using Docker, with GitHub Actions automating the build and deployment pipeline for production releases.
- Integrated Amazon Cognito for secure user authentication and Amazon S3 for image and object storage, while implementing an AI overclaiming detection pipeline to identify potentially unsupported claims.

Technical Skills

Languages: Java, JavaScript
Backend: Node.js, Express.js, REST APIs, JWT Authentication, Redis, Background Processing
Databases: MongoDB, PostgreSQL/MySQL
Cloud: AWS (Lambda, S3, EC2, RDS, IAM, CloudWatch, API Gateway, Cognito), Docker, CI/CD, Git, GitHub

Certifications

- **AWS Certified Solutions Architect – Associate** Verify
- **IBM DevOps Fundamentals** Verify
